DCIT 313 – Expert System Project
Knowledge Engineering Report
Study Method Recommendation Expert System

This expert system recommends effective study techniques to students based on their learning preferences and study challenges.

The system analyzes factors such as memory retention, learning style, concentration ability, and study habits to recommend the most suitable study methods.

The knowledge in this system is represented using rule-based logic. Each rule maps specific student learning behaviors (inputs) to appropriate study methods (recommendations).

These rules are implemented in the Prolog knowledge base and are queried through the Python interface.

1. If a student forgets information quickly and is preparing for exams, the system may recommend **Active Recall**.
2. If a student wants to retain information for a long period and is studying large amounts of content, the system may recommend **Spaced Repetition**.
3. If a student understands concepts better by explaining them to others, the system may recommend the **Feynman Technique**.
4. If a student prefers visual learning and enjoys diagrams and structured notes, the system may recommend **Mind Mapping**.
5. If a student is studying a practical course such as mathematics, programming, or engineering and learns best by doing exercises, the system may recommend **Practice-Based Learning**.
6. If a student studies alone but prefers structured and organized schedules, the system may recommend creating a **Personal Study Timetable**.
7. If a student feels bored when reading textbooks and prefers engaging methods, the system may recommend **Active Recall combined with Practice Questions**.
8. If a student procrastinates and is easily distracted, the system may recommend the Pomodoro Technique.
9. If a student prefers discussion and collaborative learning, the system may recommend group study.
10. If a student has difficulty understanding complex topics deeply, the system may recommend the **Feynman Technique combined with Mind Mapping**.

Definitions

1. Active Recall

Definition:

Active Recall is a study method where a student tests their memory instead of passively reading notes.

How it works:

- Read a topic.
- Close the book.
- Try to recall key points from memory.
- Answer practice questions without looking at notes.
- Check and correct mistakes.

Why it works:

It strengthens memory by forcing the brain to retrieve information, which improves long-term retention.

Best for:

- Exam preparation
- Theory-heavy subjects
- Students who forget information quickly

2. Spaced Repetition

Definition:

Spaced Repetition is reviewing material at increasing intervals over time.

How it works:

- Study a topic today.

- Review it tomorrow.
- Review again after 3 days.
- Review again after 1 week.
- Continue increasing the time gap.

Why it works:

It prevents forgetting by reviewing information right before it fades from memory.

Best for:

- Large course content
- Long-term memory retention
- Cumulative exams

3. Feynman Technique

Definition:

The Feynman Technique involves learning by explaining a concept in simple language as if teaching a beginner.

How it works:

- Choose a topic.
- Explain it in simple terms.
- Identify gaps in understanding.
- Review and simplify again.

Why it works:

If you cannot explain something simply, you do not fully understand it.

Best for:

- Complex subjects
- Deep understanding
- Concept-based courses

4. Mind Mapping

Definition:

Mind Mapping is a visual study method where ideas are organized around a central topic using branches.

How it works:

- Write the main topic in the center.

- Draw branches for subtopics.
- Add keywords, colors, and connections.

Why it works:

It helps visualize relationships between ideas and improves understanding.

Best for:

- Visual learners
- Theory subjects
- Big-picture thinkers

5. Pomodoro Technique

Definition:

The Pomodoro Technique is a time-management method that divides study time into short focused intervals.

How it works:

- Study for 25 minutes.
- Take a 5-minute break.
- Repeat 4 times.
- Take a longer break (15–30 minutes).

Why it works:

Short sessions improve focus and reduce mental fatigue.

Best for:

- Procrastinators
- Easily distracted students
- Poor time management

6. Pomodoro Technique with a Distraction-Free Study Environment

Definition:

This combines structured study intervals with removing distractions from the environment.

How it works:

- Turn off notifications.
- Keep phone away.
- Clear the desk.
- Study in 25-minute focused sessions.

Why it works:

It reduces external interruptions and increases productivity.

Best for:

- Students easily distracted by social media
- Students who struggle to maintain concentration

7. Feynman Technique Combined with Mind Mapping

Definition:

This method combines visual organization with teaching-based understanding.

How it works:

- Create a mind map of a topic.
- Use it to explain the concept in simple terms.
- Identify weak areas.
- Update the mind map with clearer explanations.

Why it works:

It strengthens both conceptual understanding and visual memory.

Best for:

- Complex topics
- Visual learners
- Students who want deep mastery

8. Practice-Based Learning

Definition:

Practice-Based Learning is a study method where students improve understanding by actively solving problems and applying concepts rather than only reading theory.

How it works:

- Solve practice problems
- Apply concepts to real examples
- Repeat exercises until mastery

Why it works:

Applying knowledge through practice strengthens understanding and helps students develop problem-solving skills.

Best for:

- Mathematics

- Programming
- Engineering
- Technical or problem-solving courses

9. Personal Study Timetable

Definition:

A Personal Study Timetable is a structured schedule that helps students organize their study time by allocating specific periods for different subjects or tasks.

How it works:

- List all subjects or topics that need to be studied.
- Allocate specific study times for each subject.
- Set realistic goals for each study session.
- Follow the timetable consistently.
- Adjust the schedule when necessary.

Why it works:

A study timetable helps students manage their time effectively and ensures that all subjects receive adequate attention.

Best for:

- Students who study independently
- Students who prefer organized study plans
- Students with multiple subjects to cover

10. Group Study

Definition:

Group Study is a learning method where students study together, discuss topics, and help each other understand difficult concepts.

How it works:

- Form a small study group with classmates.
- Discuss topics and explain concepts to one another.
- Ask and answer questions.
- Solve problems together.

- Review difficult topics as a team.

Why it works:

Collaborative learning helps students gain different perspectives and improves understanding through discussion and explanation.

Best for:

- Discussion-based learning
- Difficult topics that require explanation
- Students who learn well through interaction

Conclusion

The expert system provides study recommendations based on student learning behaviors and preferences. By applying rule-based reasoning, the system can guide students toward effective learning strategies that improve understanding, retention, and productivity.
